Falso senso de segurança

“Não deixe de lavar bem as mãos e tudo ficará bem”

Falso senso de segurança

Owen Gaffney, Stockholm Resilience Centre:

“As sociedades industriais receberam da enganosa estabilidade do Holoceno - os últimos 11.700 anos -, um falso senso de segurança. Agora, **ejetamos a Terra de seu envelope interglacial e estamos entrando em território desconhecido**”.

Owen Gaffney, “Anthropocene now”. *New Scientist*, 22/IV/2017, pp. 24-25: “Industrial societies have been given a false sense of security by the deceptive stability of the Holocene, the last 11,700 years. Now we have ejected Earth from the interglacial envelope and are heading into uncharted territory”

Os anos 2014-2020 rompem a estabilidade climática do Holoceno e excedem o Holoceno máximo

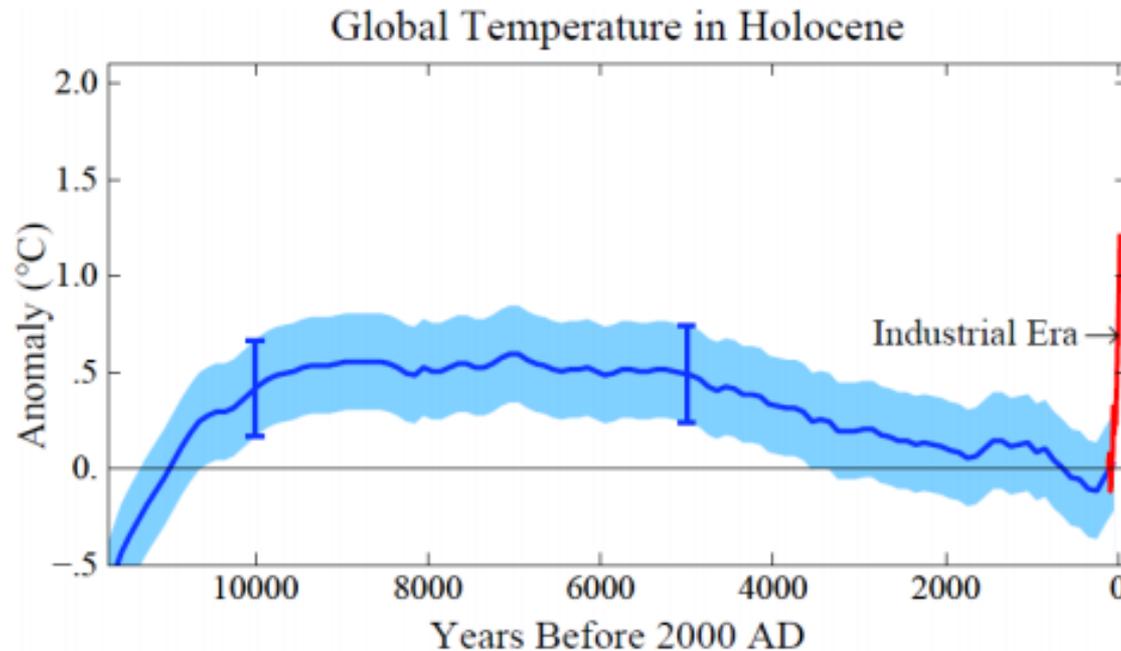

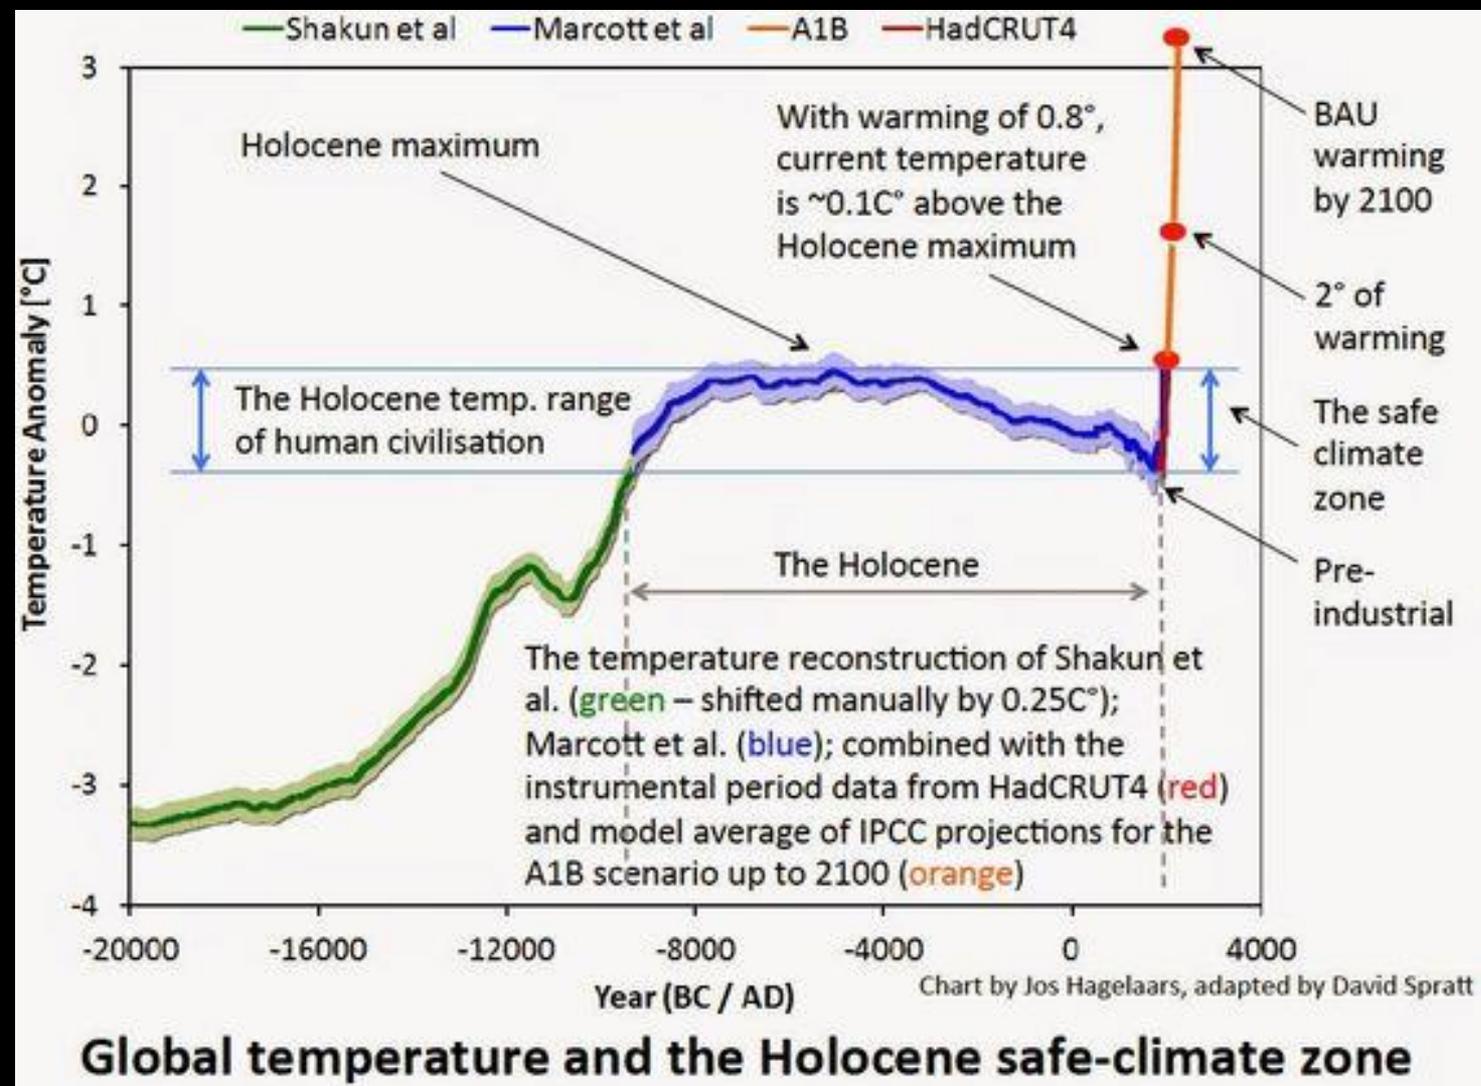

Fig. 25.1. Global temperature in the Holocene relative to 1880-1920 average.¹ Blue data are proxy temperature analysis of co-authors Shaun Marcott, Jeremy Shakun. Red line is from instrumental data for 1880-2020. Proxy data have 100-year smoothing. Light blue area is formal 95 percent confidence range.

James Hansen *et al.*,

França = 46°C

15/01/2020

CLIMATE NOW: 2019 WAS WARMEST YEAR ON RECORD IN EUROPE

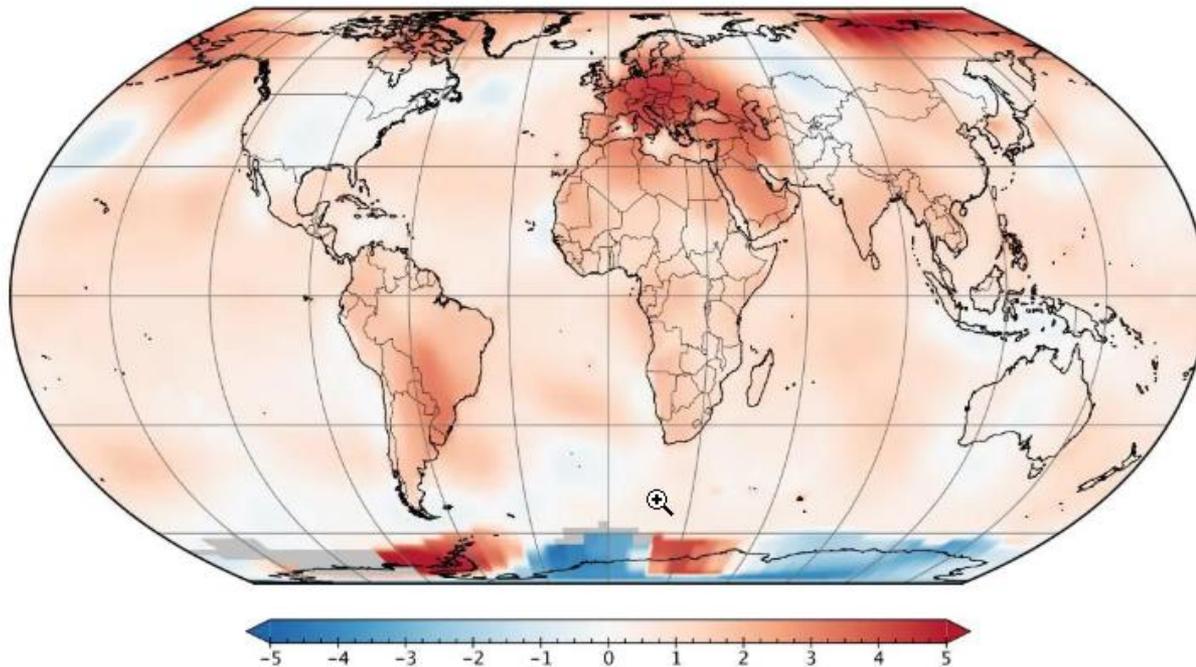

The latest information from the Copernicus Climate Change Service shows temperatures were over 1.2 degrees Centigrade above the 1981-2010 average in 2019. The summer heatwave saw national temperature records being broken across western Europe; we saw 38.7 degrees in the UK, 42.6 degrees in Germany, and 46 degrees in southern France, plus new temperature records also in Luxembourg, Belgium and the Netherlands.

September 2020 Was Warmest September On Record — World & Europe

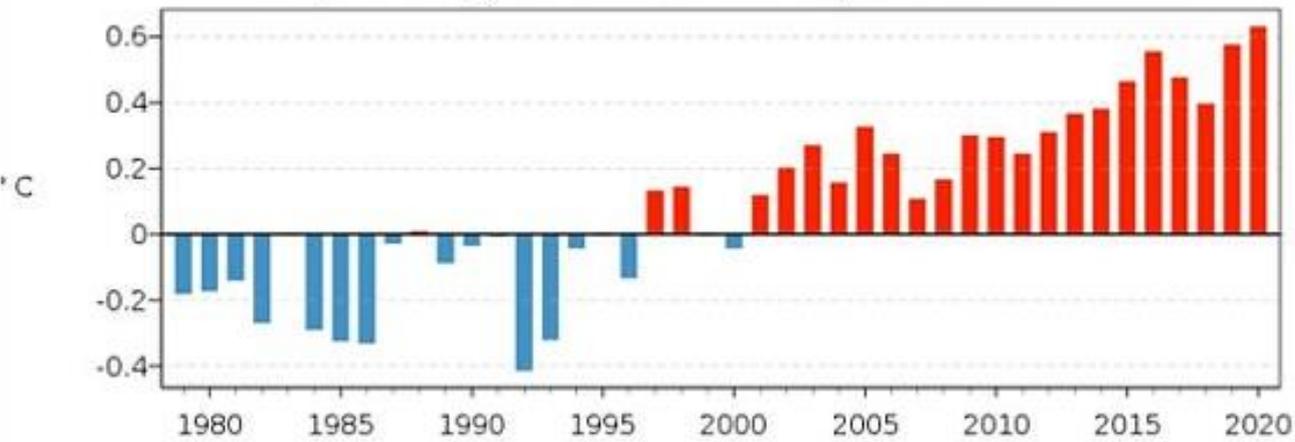

October 8th, 2020 by [Guest Contributor](#)

By the Copernicus Climate Change Service (C3S), [The Copernicus Programme](#).

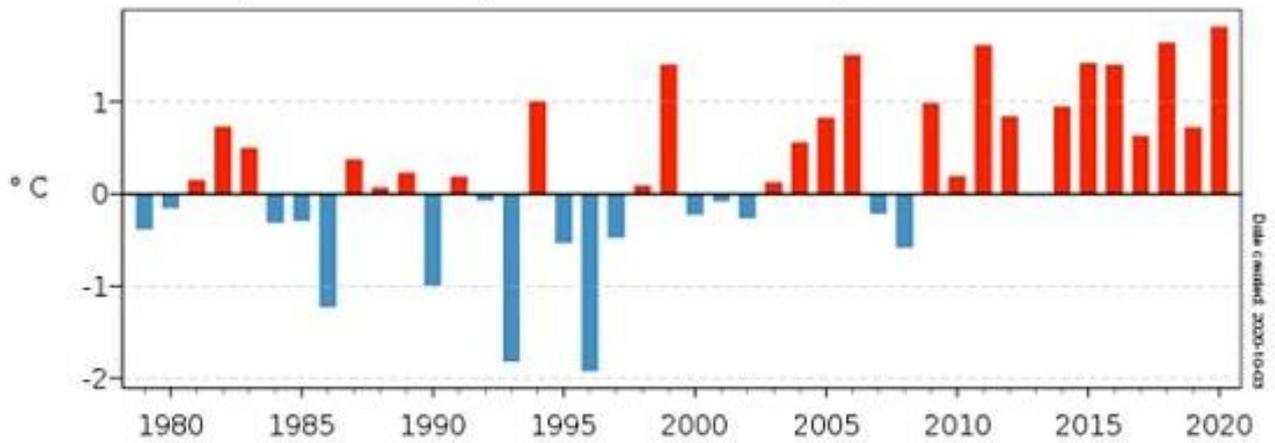

Scientists from the ECMWF Copernicus Climate Change Service reveal that globally September 2020 was 0.05°C warmer than September 2019, previously the warmest on record, making it the world's warmest September so far. Meanwhile, temperatures in the Siberian Arctic continue to be much above average and Arctic sea ice is at its second lowest extent since satellite records began.

Setembro foi o mais quente mês dos registros históricos

A corrida entre 2016 e 2020

2020 likely to be the warmest year on record globally

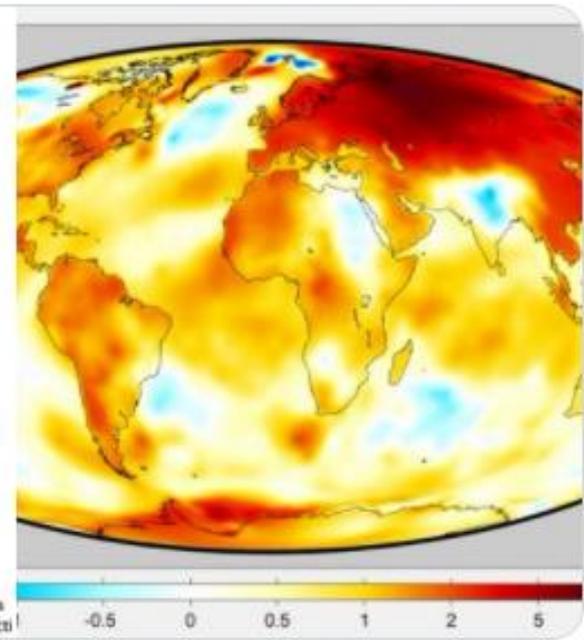

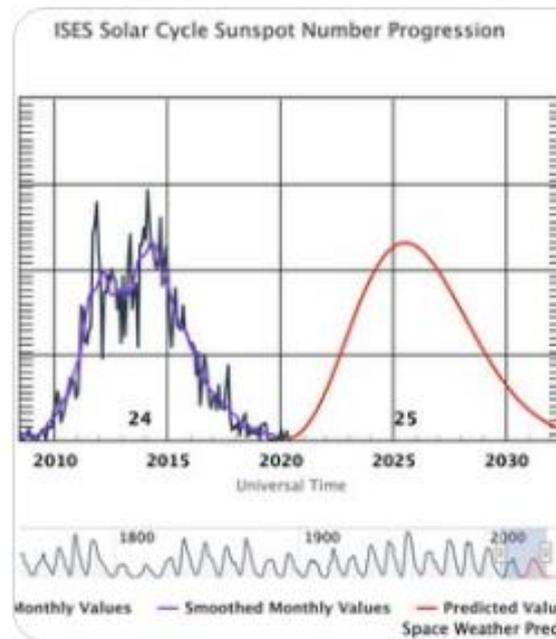

BY JEFF BERARDELLI

JUNE 15, 2020 / 9:55 AM / CBS

Jeff Berardelli @WeatherProf · 13 de jun

Solar minimum is not so grand I guess. Jan-May is 2nd warmest period on record and Berkeley Earth says the chance of 2020 being the warmest year on record is almost 90%.

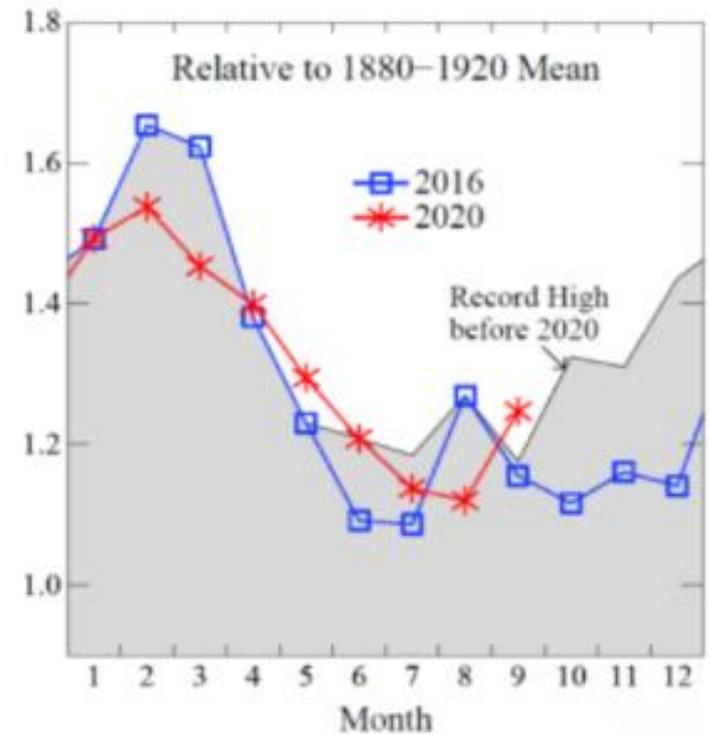

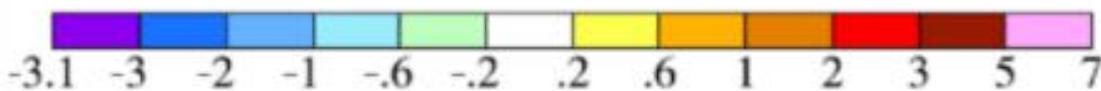

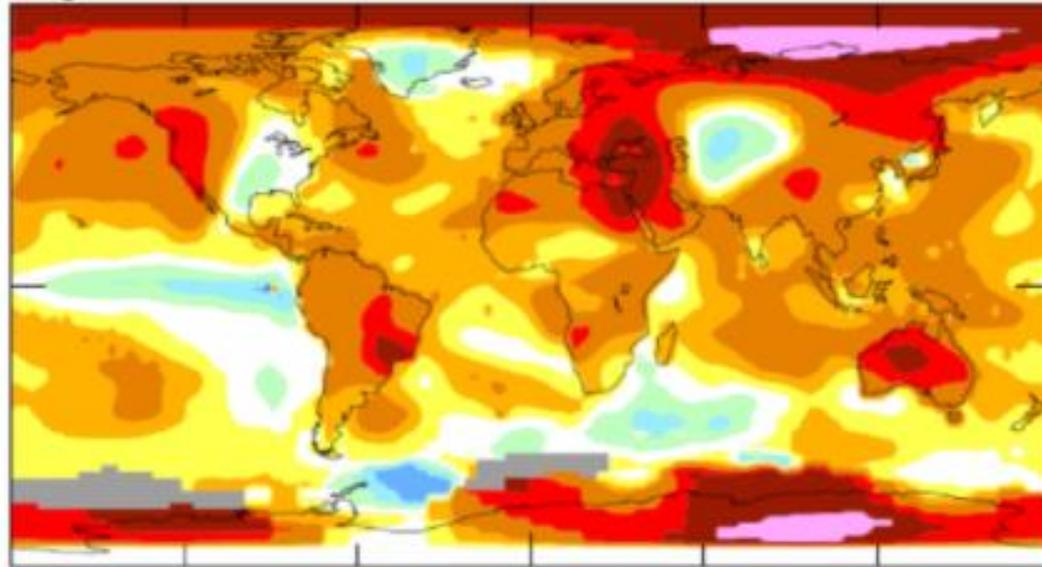

Últimos 7 anos
(2014-2020):
os mais quentes
dos registros
históricos

<https://www.cbsnews.com/news/warmest-year-on-record-2020-likely/#:~:text=The%20persistence%20of%20the%20warm,up%20as%20the%20warmest%20year.>

A corrida entre 2016 e 2020

September 2020, warmest

1.00

September 2020 was the warmest September since adequate global data began in 1880. Global temperature was $+1.00^{\circ}\text{C}$ relative to the 1951-1980 base period and $+1.25^{\circ}\text{C}$ relative to 1880-1920.

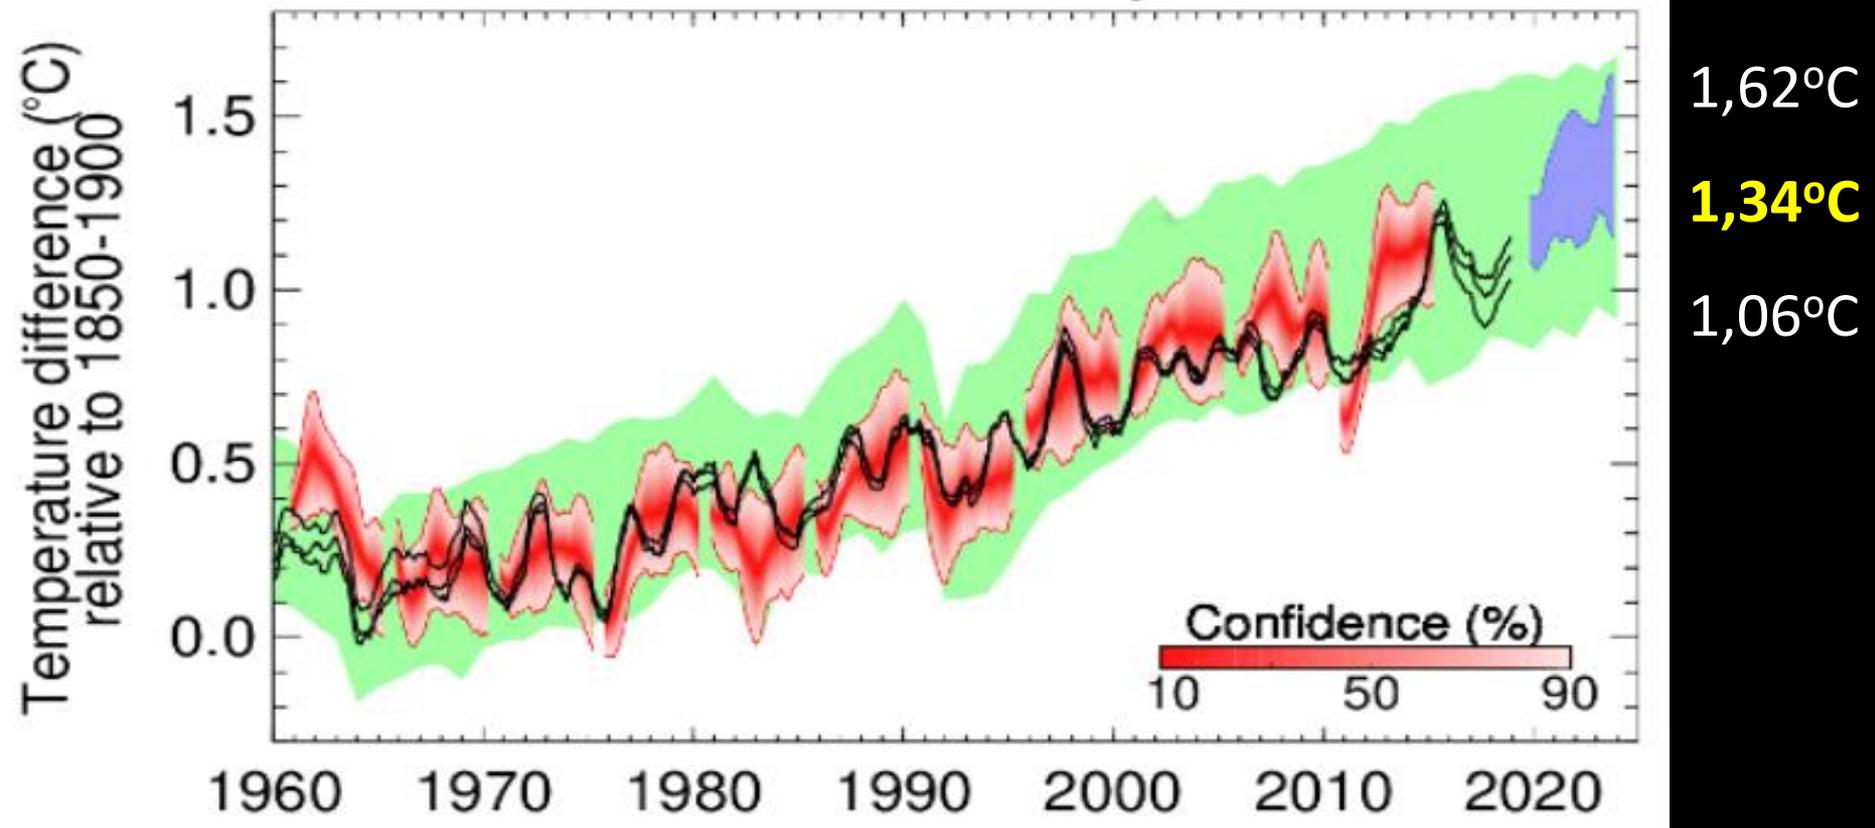

Futuro imediato do aquecimento

Os próximos 5 a 10 anos levarão ***inevitavelmente*** a um aquecimento médio global igual ou superior a 1,5°C

2020 – 2024: 1,06°C - 1,62°C acima de 1850-1900 ou
0,45°C a 1,01°C acima de 1981-2010

Global annual temperature

Global annual temperature

MET Office, “Decadal forecast” Janeiro 2020

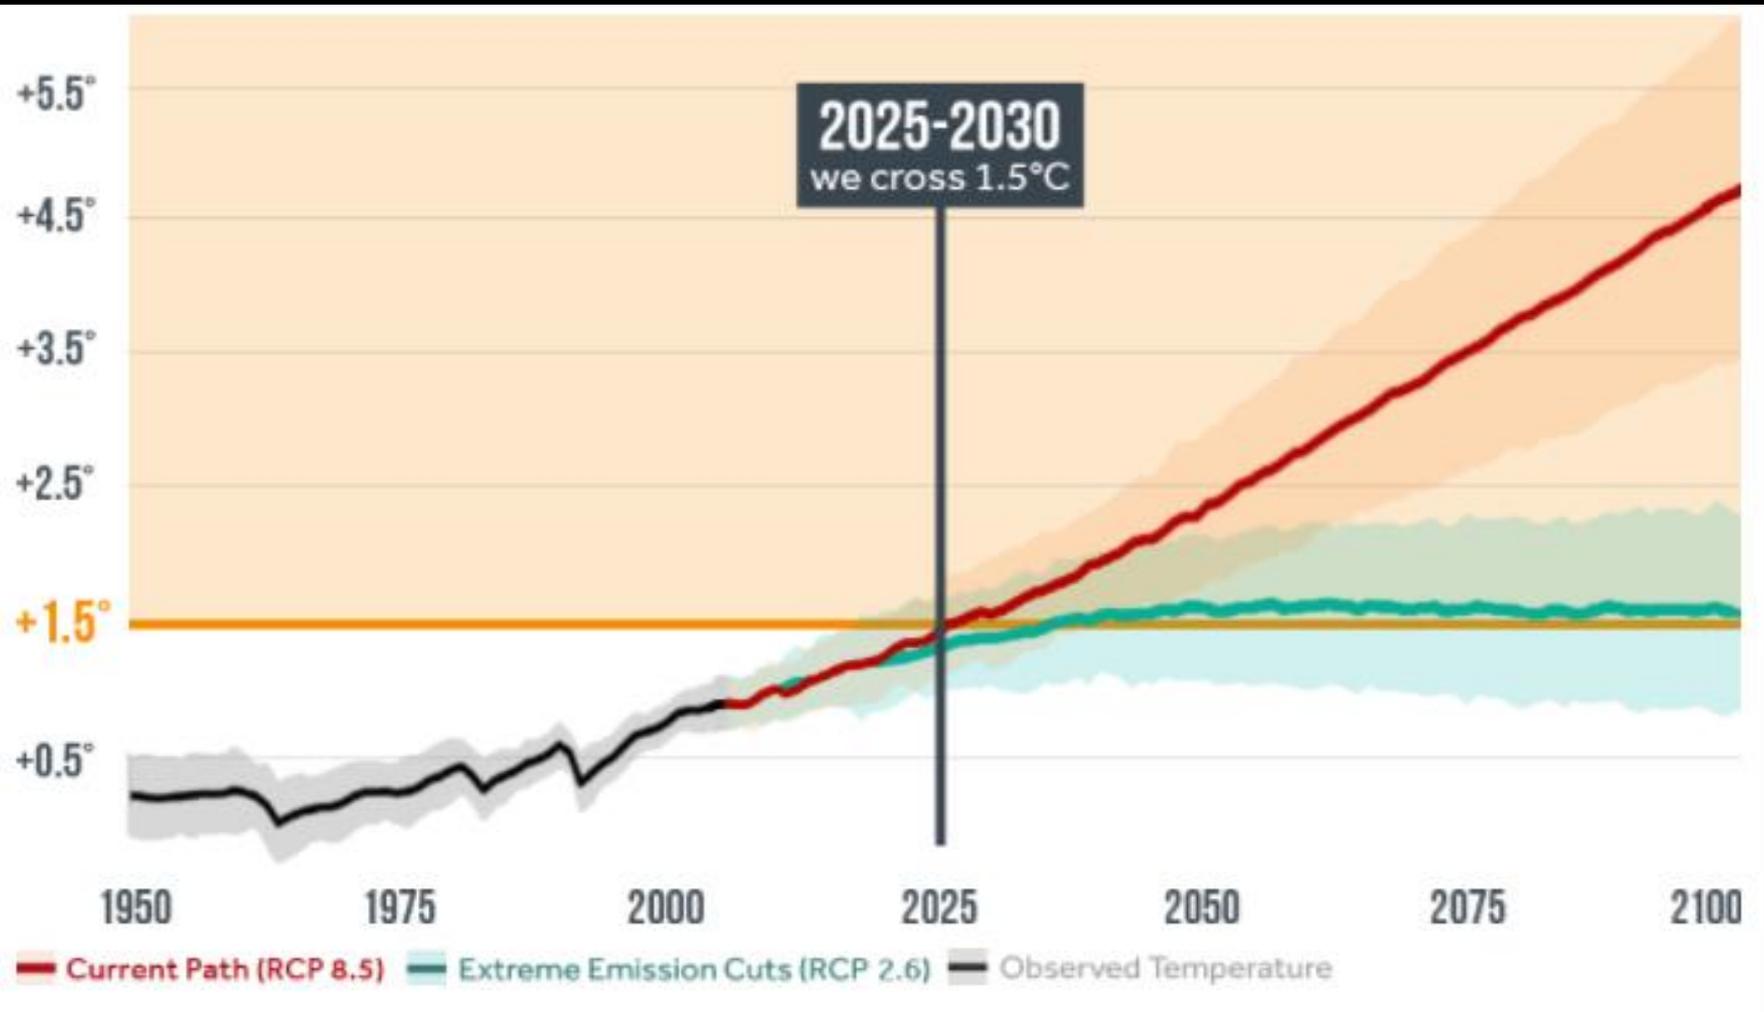

<https://www.metoffice.gov.uk/research/climate/seasonal-to-decadal/long-range/decadal-fc/index>

Há 20% de chances de um aquecimento médio global de 1,5°C até 2024 e as chances aumentam com o tempo

There is a ~**20%** chance that one of the **next 5 years** will be at least **1.5 °C warmer** than pre-industrial levels, but the chance is increasing with time.

1,5°C em 2025 - 2030 (Climate Central)

Climate Central Research Report, "Flirting with the 1.5°C Threshold". 20/IV/2016

<http://www.climatecentral.org/news/world-flirts-with-1.5C-threshold-20260>

Um aquecimento médio global $> 1,5^{\circ}\text{C}$ é perigoso

Um aquecimento médio global $> 2^{\circ}\text{C}$ é desastroso

Um aquecimento médio global $> 3^{\circ}\text{C}$ é catastrófico,
implicando a inviabilização das sociedades

Um aquecimento médio global $> 4^{\circ}\text{C}$ é
desconhecido, implicando ameaças existenciais

“Não temos evidência de que um aquecimento de 1,9°C é algo com que se possa lidar facilmente, e 2,1°C é um desastre”

Sir Brian Hoskins

Diretor do Grantham
Institute for Climate Change,
Imperial College, Londres:

Cf Andrew Simms, “A cat in hell’s chance – why we’re losing the battle to keep global warming below 2C”, *The Guardian*, 19/11/2017: “We have no evidence that a 1.9C rise is something we can easily cope with, and 2.1 is a disaster.”

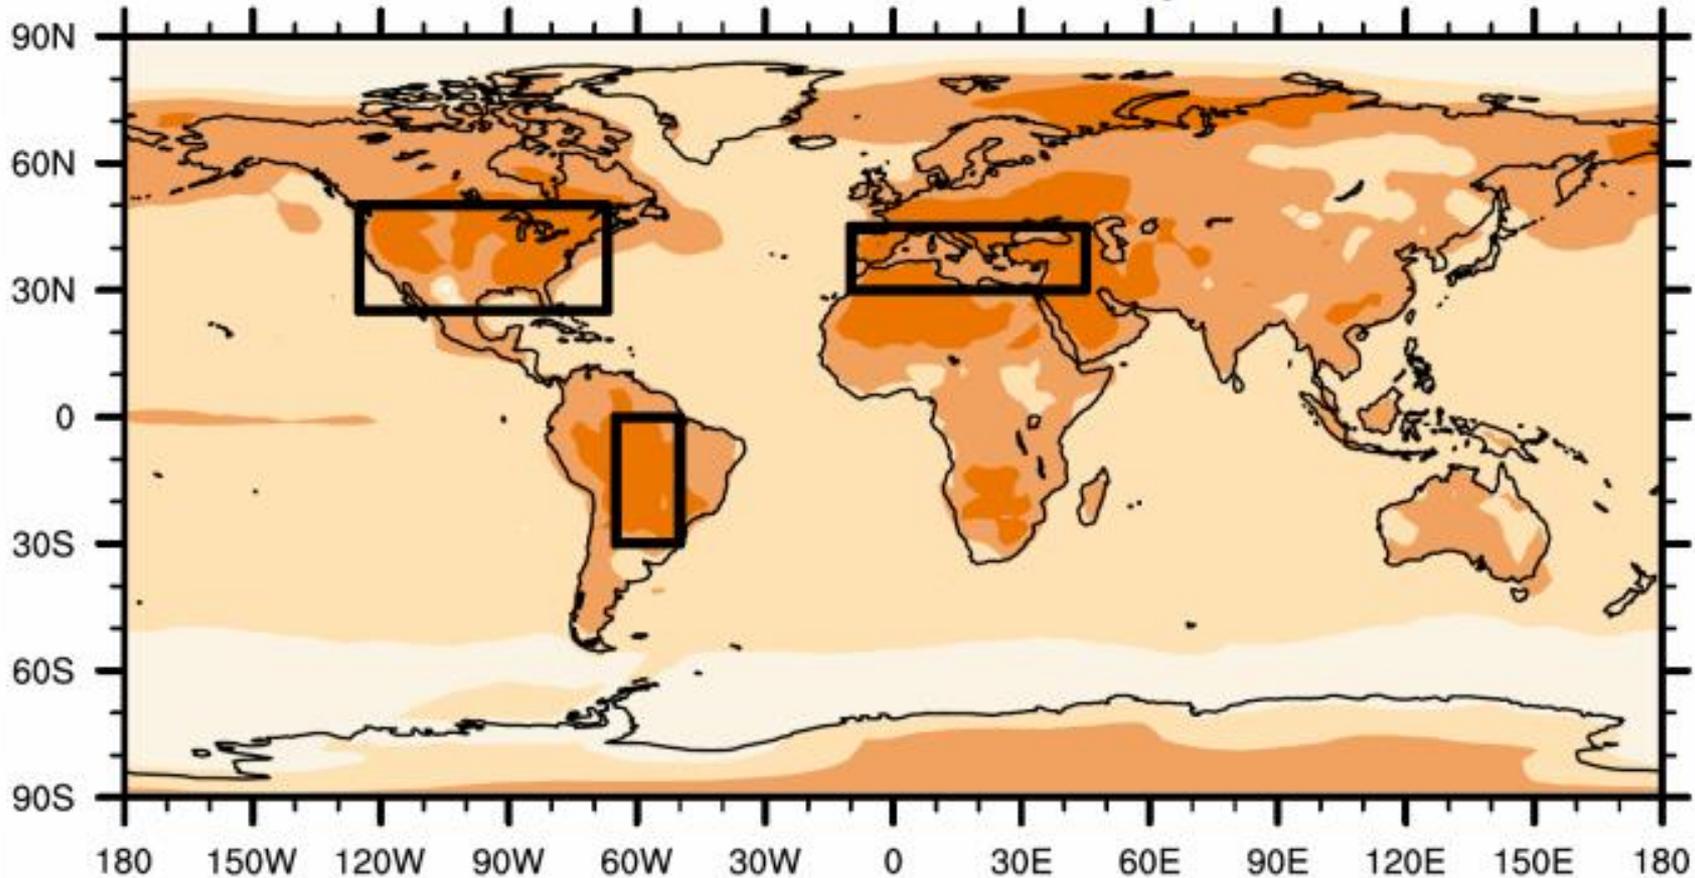

“O limite de 2°C das temperaturas médias em relação ao período pré-industrial pode ser cruzado em 2030 no Mediterrâneo, na **região central do Brasil** e nos EUA”

Sonia Seneviratne *et al.*, “Allowable CO₂ emissions based on regional and impact-related climate targets”. *Nature*, 529, 28/1/2016: «a regional 2°C threshold was passed in the simulations around year 2000 for TNn in the Arctic, while it is projected to be reached by ca. 2030 for TXx in the Mediterranean, Brazil and the contiguous U.S., and only by the mid-2040s for the global mean temperature, under the business-as-usual (RCP8.5) emissions scenario.”

Aquecimento global vs regional

TXx local change when $\Delta T_{\text{glob}} = 2^{\circ}\text{C}$

Intensity of hot extremes (TXx): let TX be the daily maximum temperature, then TXx is the annual maximum value of TX

Climate Change Risks in Brazil

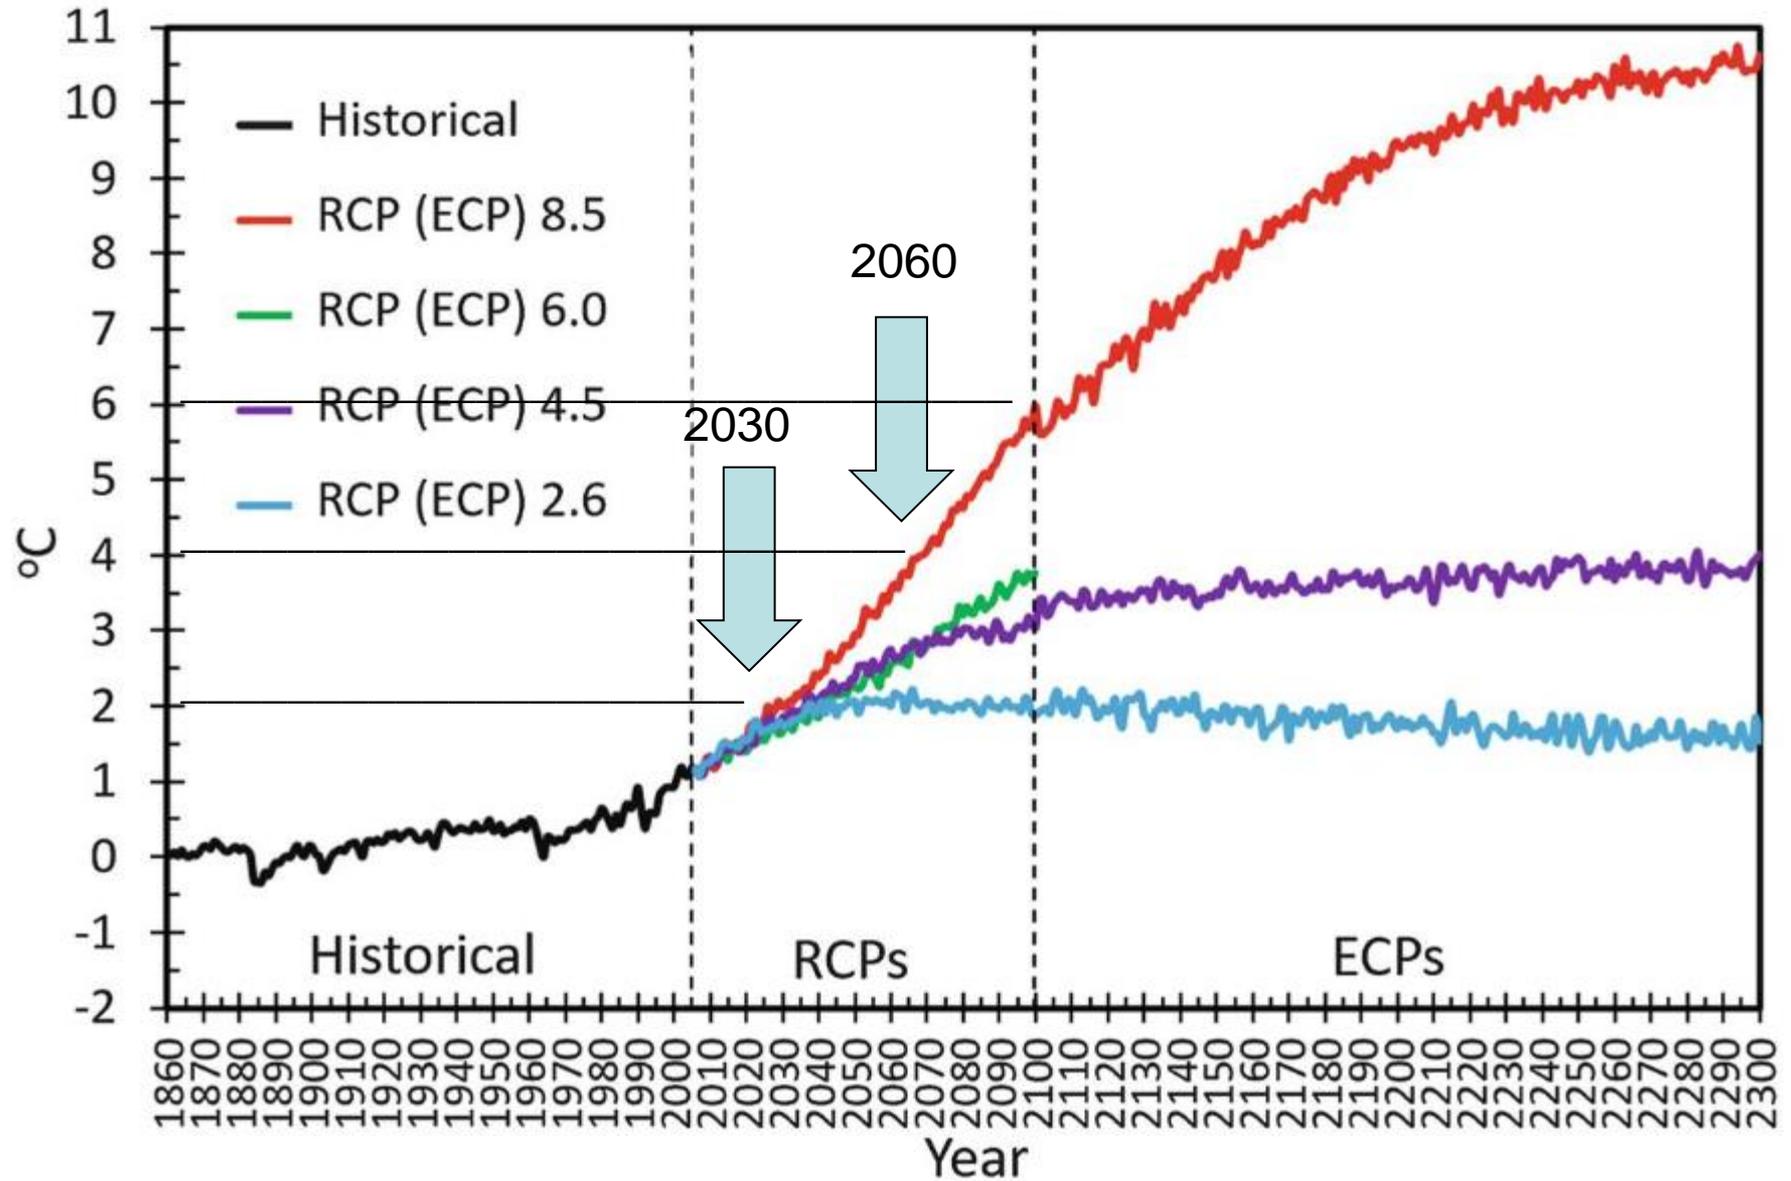

Preface

In a high greenhouse gas emissions scenario, the country has a high likelihood (over 70%) of suffering a greater than 4°C temperature rise before the end of the century. For high degrees of global warming exceeding

Num cenário de altas emissões de gases de efeito estufa, o país tem uma alta probabilidade (acima de 70%) de sofrer um aumento de temperatura maior que 4°C antes do fim do século

CLIMATE CHANGE RISKS IN BRAZIL

Para o capitalismo, a pandemia é apenas um acidente de percurso

Ela não terá impacto sobre o aquecimento futuro

Porque as emissões de gases de efeito estufa já estão voltando ao “normal”

Em abril, as emissões globais diárias haviam caído ~17% em relação aos níveis médios de 2019.

Daily global CO₂ emissions decreased by -17% (-11 to -25% for $\pm 1\sigma$) by early April 2020 compared with the mean 2019 levels,

O que fazer?

4 passos

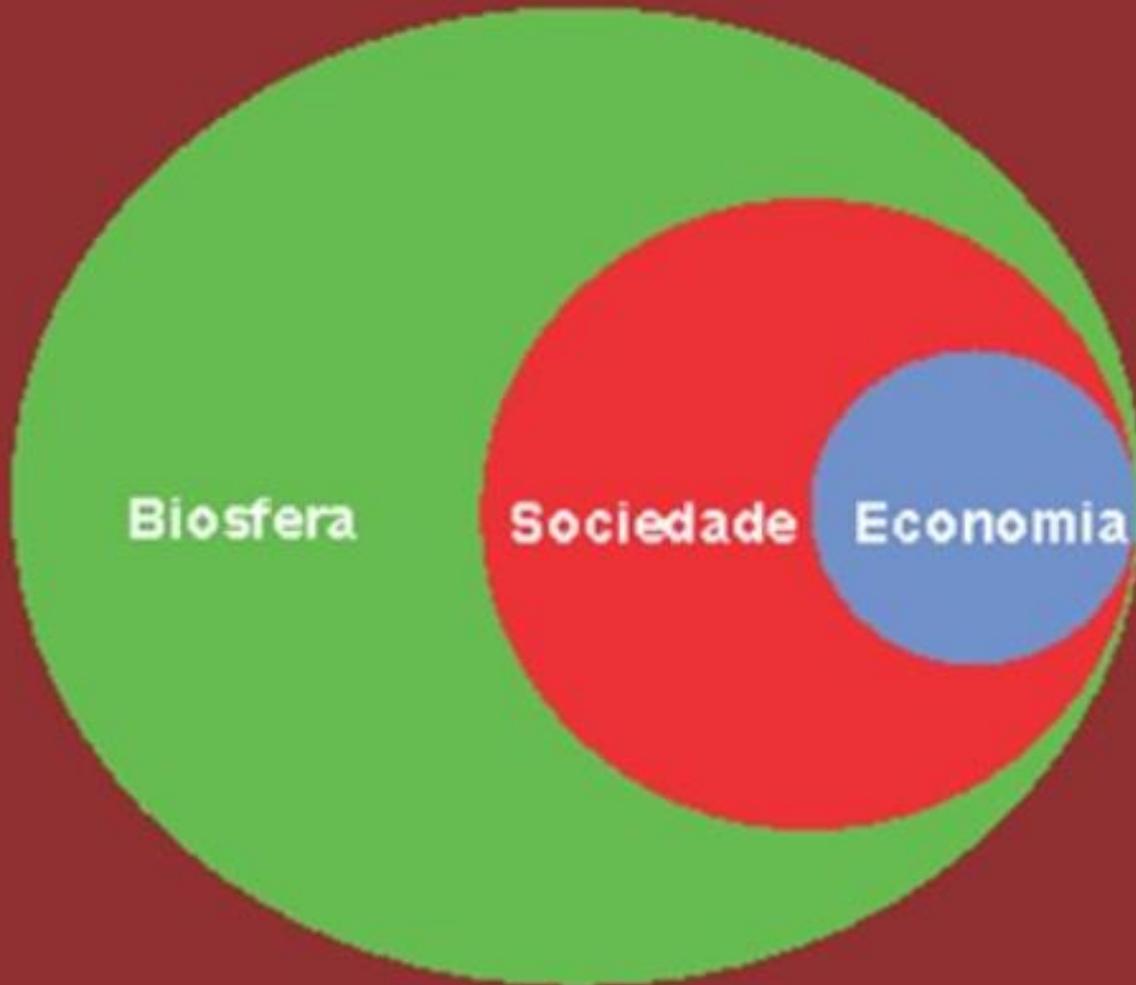

1. Reconhecer a realidade
2. Repensar as premissas
3. Acreditar que é possível mudar
4. Agir para mudar

Passo 1 - **reconhecer** a gravidade extrema da situação atual: esta é a década da bifurcação

Passo 2 – repensar nossas premissas

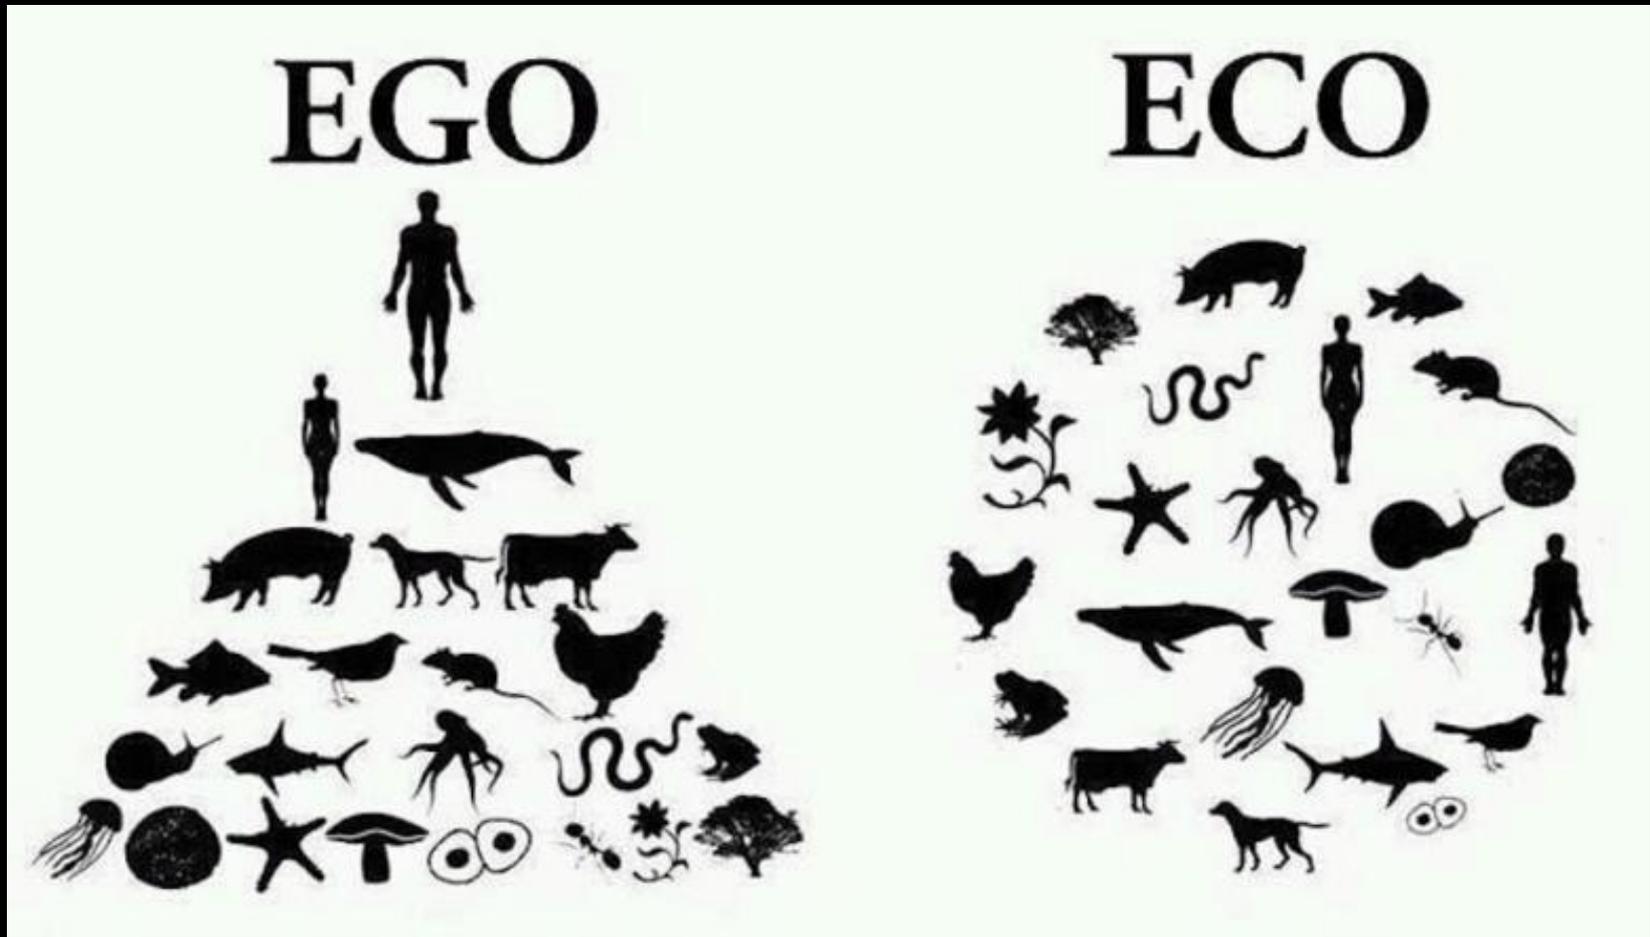

Repensando nossos esquemas mentais

“A economia é um subsistema da ecologia, e não o contrário”

Herman Daly

Abandonar o antropocentrismo, obstáculo maior – jurídico e mental – à compreensão de que a posição atual do homem na biosfera é, ao mesmo tempo, ecocida e suicida.

Passo 3 – Voltar a acreditar em nossa capacidade coletiva de mudar o mundo

Para que uma mudança aconteça, é preciso acreditar que ela é possível

A black and white portrait of Romain Rolland, a French philosopher, writer, and pacifist. He is shown from the chest up, wearing a dark suit jacket, a white shirt, and a dark tie. He has a serious expression and is looking slightly to the right of the camera. The background is dark and out of focus.

Il faut savoir allier le pessimisme de l'intelligence à l'optimisme de la volonté.

—Romain Rolland

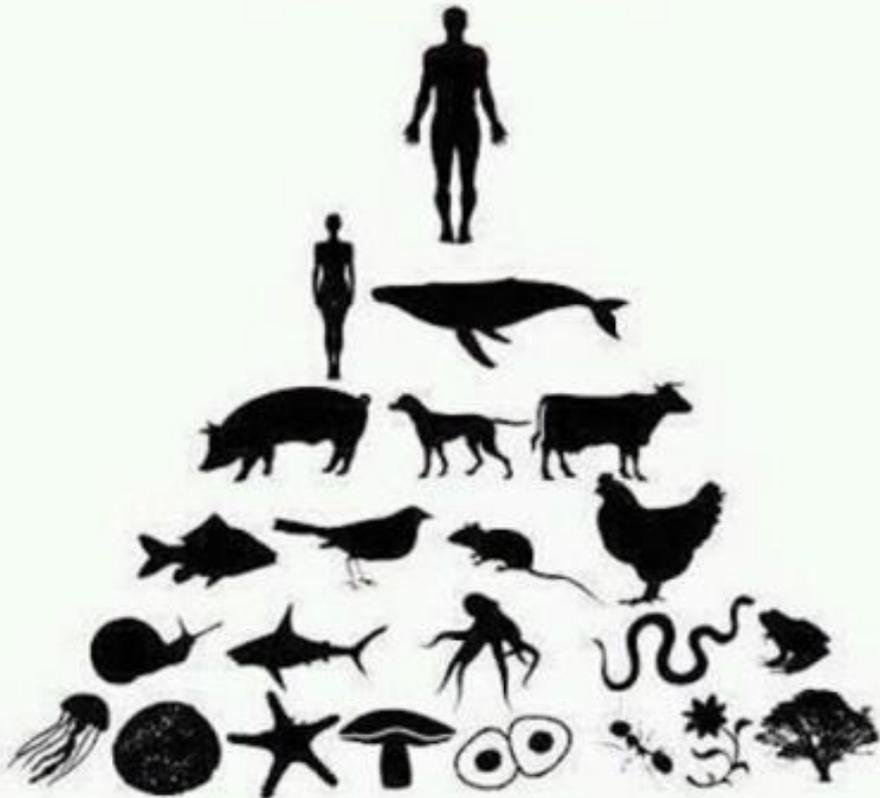

Passo 4 - agir para mudar:

- diminuição da desigualdade
- Minimização dos impactos humanos sobre o clima, água, florestas, biodiversidade
- Diminuir drasticamente o consumo de carne
- Avaliar as alternativas políticas em função dessa emergência climática e ambiental
